

<div id='aboutme\_container'>

<p>I started learning computer programming in high school where I learned Applesoft Basic and Pascal in the early '80s. Since that time I've been doing different projects both independently or for my employers. I have developed websites for many years and have included different examples of that work on this web site. I have worked using Flash, PHP, MySQL, Java, and CSS. I have also done sites using ASP and application development using C#.net and VB.net. I am currently working on a project using C# and MySQL that is for import companies to track incoming containers and inventory. It also handles accounts receivable and payables. I am also creating a web interface for salespeople and customers to check pricing, inventory levels, and create orders. My education includes studying computer information systems at DeVry University and I have also been taking classes at Estrella Mountain Community College in order to refresh and expand my knowledge with the latest languages and techniques. I am a quick learner and am able to pick up new systems and languages quickly.</p>
